Course plan

Key to the plan

The nodes don't represent equal amounts of time, for example, the fibonacci sequence node represents about half a lecture, whereas the big-oh node might be two lectures.

Positions and colors

- CENTRE: main topics
- LEFT: background theory
- RIGHT: examples and applications
- RED: algorithmic complexity
- BLUE: sorting
- YELLOW: graph theory
- GREEN: data structures
- ORANGE: scientific computing

Nodes

- (a) **introduction:** What is an algorithm.
- (b) **insert:** Insert sort, an example algorithm.
- (c) **big-oh** Algorithmic complexity.
- (d) **limits** Limits in the mathematical sense.
- (e) **recursive eqns** How to solve recursive equations
- (f) search: Big-oh for binart and linear.
- (g) **recursion:** Recursion and recursive algorithms.
- (h) **fibonacci:** The interesting example of the fibonacci sequence.
- (i) master: The master theorem.
- (j) quicksort: Quicksort.
- (k) **merge sort:** Merge sort.
- (l) graphs: Introduction to graph theory.
- (m) some theory: Some definitions and the Euler theorem.
- (n) dijkstra: Dijkskra's algorithm.
- (o) data: Data structures, linked lists and binary trees.

Algorithms - course plan

- (p) avl trees: Balanced trees and the AVL rotations.
- (q) adversarial: Adversarial search algorithms.
- (r) binary heap: Binary heaps.
- (s) hashing: Hash functions and hashing data.
- (t) science: Scientific computing.
- (u) some math: Revising a bit of calculus.
- (v) simplex: The Nelder Meade algorithm.
- (w) mcmc: Markov chain Monte Carlo

The last section is aspirational, it is likely there will not be time to discuss it and it will not be examined.
